DRILL BIT PACKAGE ASSEMBLY**CROSS REFERENCE TO RELATED APPLICATIONS**

This application claims the benefit of U.S. Provisional Application No. 61/823,075 filed May 14, 2013, which is incorporated herein by reference in its entirety.

FIELD OF THE INVENTION

The present invention relates to a kit system for use in spinal surgery, and more particularly to a kit system that includes a reusable bit driver and disposable drill bits.

BACKGROUND OF THE INVENTION

Typically, in Anterior Discectomy and Fusion (ACDF) surgery and other spine related surgeries, manual drivers and drill bits are reused and have to be sterilized with each use.

SUMMARY OF THE PREFERRED EMBODIMENTS

In accordance with a first aspect of the present invention there is provided a kit system for use in surgery that includes a disposable drill bit, a disposable battery, an adjustable drill guide, and at least one of a battery powered driver and a manual driver. In a preferred embodiment, the adjustable drill guide and the battery powered driver and/or the manual driver are included in a first kit and the disposable drill bit and the disposable battery are included in a second kit that is separate from the first kit. Preferably, the second kit includes a plurality of disposable drill bits and a plurality of disposable batteries. In a preferred embodiment, the kit system includes both a battery powered driver and a manual driver.

In a preferred embodiment, the disposable drill bit is secured to a card assembly, and the card assembly and disposable drill bit are disposed in a sterile pouch. Preferably, the disposable drill bit includes a shaft portion and a blade portion, the shaft portion is received in a snap fit portion of the card assembly and the blade portion is received in a bit pocket of the card assembly. In a preferred embodiment, the adjustable drill guide includes an upper tube and a guide tube threadingly engaged with one another and a handle shaft that extends from the upper tube at an angle. The upper tube and the guide tube cooperate to form an internal guide tunnel that is configured to receive at least a portion of the drill bit.

In accordance with another aspect of the present invention there is provided a method that includes the steps of (a) obtaining a first kit that includes a bit driver, (b) obtaining a second kit that includes first and second disposable drill bits, (c) performing a surgery using the first disposable drill bit together with the bit driver, (d) disposing of the first disposable drill bit, and (e) performing a surgery using the second disposable drill bit together with the bit driver. Preferably, the first kit includes an adjustable drill guide, and step (c) includes performing the surgery using the first disposable drill bit together with the bit driver and the adjustable drill guide, and step (e) includes performing the surgery using the second disposable drill bit together with the bit driver and the adjustable drill guide. In a preferred embodiment, the bit driver is a battery powered driver, the second kit includes first and second batteries, step (c) includes performing the surgery using the first disposable

2

drill bit and the first battery together with the battery powered driver and the adjustable drill guide, the method includes the step of disposing of the first battery prior to step (e), and step (e) includes performing the surgery using the second disposable drill bit and the second battery together with the battery powered driver and the adjustable drill guide.

In a preferred embodiment, the first disposable drill bit is secured to a first card assembly, the first card assembly and the first disposable drill bit are disposed in a first sterile pouch, the second disposable drill bit is secured to a second card assembly, and the second card assembly and the second disposable drill bit are disposed in a second sterile pouch.

In accordance with another aspect of the present invention there is provided a card assembly for use with a drill bit. The card assembly includes a main body portion that includes first and second ends and a snap fit portion positioned between the first and second ends. The snap fit portion includes first and second arms that cooperate to define a receiver slot and a bit recess, and the receiver slot is narrower than the bit recess. The card assembly also includes a shield portion connected to the first end of the main body portion along a fold. The shield portion is foldable with respect to the main body portion between a deployed position and a non-deployed position. The shield portion includes a bit opening defined therein, and the shield portion and the main body portion cooperate to define a bit pocket when the shield portion is in the deployed position. Preferably, the snap fit portion is connected to the main body portion along a fold, and the snap fit portion is foldable between a non-deployed position and a deployed position.

In a preferred embodiment, the main body portion includes a finger hole defined therein at a location adjacent the second end thereof. Preferably, the shield portion includes first and second flaps, the main body portion includes first and second slots defined therein, and the first and second flaps are received in the first and second slots when the shield portion is in the deployed position. In a preferred embodiment, the second end of the main body portion has a chevron shape.

In accordance with another aspect of the present invention there is provided a drill bit package assembly that includes a card assembly, a drill bit that includes a shaft portion and a blade portion, and is removably secured to the card assembly, and a sterile pouch that defines an interior. The card assembly and drill bit are disposed in the interior of the sterile pouch. In a preferred embodiment, the card assembly includes a main body portion that includes first and second ends, a snap fit portion positioned between the first and second ends, and a bit pocket adjacent the first end of the main body portion. Preferably, the shaft portion of the drill bit is received in the snap fit portion of the card assembly and the blade portion of the drill bit is received in the bit pocket of the card assembly. Preferably, the snap fit portion includes first and second arms that cooperate to define a receiver slot and a bit recess. The receiver slot is narrower than the bit recess, the receiver slot is narrower than a diameter of the shaft portion, and the bit recess is wider than the diameter of the shaft portion.

In a preferred embodiment, the card assembly includes a shield portion connected to the first end of the main body portion along a fold, and the shield portion is foldable with respect to the main body portion between a deployed position and a non-deployed position. The shield portion includes a bit opening defined therein. The shield portion and the main body portion cooperate to define the bit pocket when the shield portion is in the deployed position, and the

3

drill bit extends through the bit opening such that the blade portion is disposed in the bit pocket.

In accordance with another aspect of the present invention there is provided an adjustable drill guide that includes an upper tube and a guide tube. The upper tube includes a main body portion, external threads disposed on the main body portion, and a collet extending from a distal end of the main body portion. An upper tube tunnel extends axially through the upper tube, and at least a portion of the upper tube tunnel includes internal threads. The guide tube has a proximal end and a distal end and includes a guide tube tunnel extending therethrough. The guide tube includes external threads on a proximal end thereof that are matingly engaged with the internal threads of the upper tube. The upper tube tunnel and the guide tube tunnel cooperate to define an internal guide tunnel extending therethrough that is configured to receive a drill bit.

In a preferred embodiment, the adjustable drill guide includes a handle shaft that extends from the upper tube at an angle between about 10° and about 90°. Preferably, the main body portion includes a window defined therein and includes measurement indicia disposed adjacent the window. The proximal end of the guide tube is visible through the window. In a preferred embodiment, the adjustable drill guide includes a barrel having a barrel tunnel extending axially therethrough and that includes internal threads that are matingly received on the external threads of the upper tube. The guide tube extends through the barrel tunnel and the collet.

Generally, the present invention includes single-use, pre-packaged sterile, disposable drill bits to be used during Anterior Discectomy and Fusion (ACDF) surgery, and other spine related surgeries, small bone surgeries, and craniomaxillofacial surgeries in conjunction with a battery powered reusable driver.

In accordance with an aspect of the present invention, there is provided a kit for use in spinal surgery. The kit preferably includes a battery powered bit driver (drill), a manual bit driver, a disposable bit, an adjustable drill guide to facilitate linear drilling and depth control as the bit is drilled through or into bone or through any plating system (e.g., a cervical plate) to form a screw hole, and a disposable battery. In a preferred embodiment, the kit includes a sterilizable tray. Preferably, the proximal end of the bit and the collet of the driver uniquely mate with each other. Preferably, the powered bit driver is configured such that it is in-line and the battery is snap fitted to the distal end of the driver to provide for ready replacement.

In accordance with another aspect of the present invention, there is provided a system for facilitating ACDF surgery that includes providing an in-line battery powered driver to a user of the driver; and providing a pack of more than one individually wrapped, pre-sterilized and disposable drill bits and/or batteries to the user. A new drill bit and/or new battery is used in conjunction with the driver during each surgery. Preferably, each disposable drill bit is packaged individually within sterile packaging. Preferably, each disposable battery is also packaged individually within sterile packaging. In a preferred embodiment, the sterile packaging includes a plastic card (holder) that secures the bit in place. The card has a shield portion or flap that protects the sharp edge of the bit from coming into contact with the outer pouch. That bit card fits into a pouch and is sealed for sterilization. In a preferred embodiment, the pouch is made of Tyvek®. However, this is not a limitation on the present invention, and the pouch can be made of other materials.

4

The invention, together with additional features and advantages thereof, may be best understood by reference to the following description.

BRIEF DESCRIPTION OF THE DRAWINGS

FIG. 1 is a plan view of a first kit that includes an adjustable drill guide (showing two different angled handles), a manual driver and a battery powered driver in accordance with a preferred embodiment of the present invention;

FIG. 2 is a perspective view of a second kit that includes a plurality of sterile drill bit package assemblies and a plurality of sterile battery packages for use with the first kit of FIG. 1;

FIG. 3 is a plan view of a card assembly in accordance with a preferred embodiment of the present invention;

FIG. 3A is close up of the snap fit portion of the card assembly of FIG. 3;

FIG. 4 is an exploded view of a card assembly and pouch in accordance with a preferred embodiment of the present invention;

FIG. 5 is a perspective view of the drill bit package assembly;

FIG. 6 is an elevational view of an adjustable drill guide together with a drill bit in accordance with a preferred embodiment of the present invention;

FIG. 7 is an exploded view of the adjustable drill guide of FIG. 6;

FIG. 8 is a close up of the upper tube and barrel of the adjustable drill guide of FIG. 6 showing the window and measurement indicia;

FIG. 9 is a top plan view of the adjustable drill guide of FIG. 6;

FIG. 10 is a cross section taken along line 10-10 of FIG. 9;

FIG. 11 is a perspective view of a drill bit in accordance with a preferred embodiment of the present invention;

FIG. 12 is a perspective view of a manual driver in accordance with a preferred embodiment of the present invention;

FIG. 13 is an end view of the manual driver of FIG. 12; and

FIG. 14 is a perspective view of a battery powered driver and battery exploded therefrom in accordance with a preferred embodiment of the present invention.

Like numerals refer to like parts throughout the several views of the drawings.

DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENTS

The following description and drawings are illustrative and are not to be construed as limiting. Numerous specific details are described to provide a thorough understanding of the disclosure. However, in certain instances, well-known or conventional details are not described in order to avoid obscuring the description. References to one or an other embodiment in the present disclosure can be, but not necessarily are, references to the same embodiment; and, such references mean at least one of the embodiments.

Reference in this specification to “one embodiment” or “an embodiment” means that a particular feature, structure, or characteristic described in connection with the embodiment is included in at least one embodiment of the disclosure. Appearances of the phrase “in one embodiment” in various places in the specification do not necessarily refer to

5

the same embodiment, nor are separate or alternative embodiments mutually exclusive of other embodiments. Moreover, various features are described which may be exhibited by some embodiments and not by others. Similarly, various requirements are described which may be requirements for some embodiments but not other embodiments.

The terms used in this specification generally have their ordinary meanings in the art, within the context of the disclosure, and in the specific context where each term is used. Certain terms that are used to describe the disclosure are discussed below, or elsewhere in the specification, to provide additional guidance to the practitioner regarding the description of the disclosure. For convenience, certain terms may be highlighted, for example using italics and/or quotation marks: The use of highlighting has no influence on the scope and meaning of a term; the scope and meaning of a term is the same, in the same context, whether or not it is highlighted. It will be appreciated that the same thing can be said in more than one way.

Consequently, alternative language and synonyms may be used for any one or more of the terms discussed herein. Nor is any special significance to be placed upon whether or not a term is elaborated or discussed herein. Synonyms for certain terms are provided. A recital of one or more synonyms does not exclude the use of other synonyms. The use of examples anywhere in this specification including examples of any terms discussed herein is illustrative only, and is not intended to further limit the scope and meaning of the disclosure or of any exemplified term. Likewise, the disclosure is not limited to various embodiments given in this specification.

Without intent to further limit the scope of the disclosure, examples of instruments, apparatus, methods and their related results according to the embodiments of the present disclosure are given below. Note that titles or subtitles may be used in the examples for convenience of a reader, which in no way should limit the scope of the disclosure. Unless otherwise defined, all technical and scientific terms used herein have the same meaning as commonly understood by one of ordinary skill in the art to which this disclosure pertains. In the case of conflict, the present document, including definitions, will control.

It will be appreciated that terms such as “front,” “back,” “top,” “bottom,” “side,” “short,” “long,” “up,” “down,” and “below” used herein are merely for ease of description and refer to the orientation of the components as shown in the figures. It should be understood that any orientation of the components described herein is within the scope of the present invention.

Referring now to the drawings, wherein the showings are for purposes of illustrating the present invention and not for purposes of limiting the same, FIGS. 1-14 show a spine driver system. FIG. 1 shows a first kit 10 that generally includes a tray or container 11 having a lid 13 and that includes a battery powered driver 12, manual driver 14, and an adjustable drill guide 16 (for bit depth control). FIG. 2 shows a second kit 18 with a box or container 19 that includes a plurality of sterile, disposable drill bits 20 (provided in a drill bit package assembly 26 that includes a sterile pouch 30) and a plurality of sterile, disposable batteries 24 (provided in a battery package 29 that includes a sterile pouch 30).

As discussed above, generally, the present invention includes single-use, pre-packaged sterile, disposable drill bits 20 to be used during Anterior Discectomy and Fusion (ACDF) surgery and other spine related surgeries in con-

6

junction with the battery-powered reusable driver 12. In use, the hospital, surgery center or surgeon who ultimately performs the surgery is provided with the first kit 10, which is reusable. The surgeon is then provided with the second kit 18, which includes the disposable drill bit package assemblies 26 and battery packages 29, respectively. In another embodiment, the disposable drill bit package assemblies 26 and battery packages 29 can be provided in separate boxes or in any other type of container, bag, etc. The inclusion of a box is not limiting. For each surgery performed, the components of the first kit 10 can be reused, while a new disposable drill bit 20 and battery 24 are used. The system generally includes a reusable first kit 10 (and the components thereof) and the single use drill bits 20 and batteries 24. In another embodiment, the batteries 24 can be omitted and the second kit 18 only includes the drill bits 20 or disposable drill bit package assemblies 26.

In a preferred embodiment, the tray 11 and components thereof are sterilizable. However, this is not a limitation on the present invention. It will be appreciated by those of ordinary skill in the art that the manual driver 14 is included for surgeons who do not wish to use the battery powered driver 12 or in situations where the battery powered driver 12 is otherwise not usable. In another embodiment, the manual driver 14 can be omitted from the first kit 10. In yet another embodiment, the battery powered driver 12 can be omitted from the first kit 10. Any type of bit driver is within the scope of the present invention.

It is contemplated that the first kit 10 can be provided for free as a loaner or on consignment to the user, and the disposable drill bits 20 and batteries 24 can be sold to the user as needed. The user can continue to keep the first kit 10 provided they stock the disposable bits 20 and batteries 24 and maintain them at a predetermined volume.

For the initial use, the first kit 10 can include a disposable drill bit 20 and/or a disposable battery 24. However, it will be understood, that the disposable drill bit 20 and disposable battery 24 are disposed after the initial surgery, wherein the powered driver 12, manual driver 14 and adjustable drill guide 16 can be reused as desired.

In a preferred embodiment, the driver 14 and drill bit 20 are in-line or co-axial. However, this is not a limitation on the present invention and the driver 14 and drill bit 20 can include an offset.

As is best shown in FIGS. 3-5, in a preferred embodiment, the drill bits 20 are provided in the drill bit package assembly 26 that includes a “snap-fit” bit card assembly 28 that is received in a pouch 30. The card assembly 28 is preferably made of plastic or the like. As shown in FIG. 3, the card assembly 28 includes a main body portion 32 and a shield portion 34. The main body portion 32 includes a snap fit portion 36 and a finger hole 37 defined therethrough. Prior to the drill bit 20 being placed on the card assembly 28, the card assembly 28 is in a flat configuration (FIG. 3).

In a preferred embodiment, the shield portion 34 is foldable with respect to the main body portion 32 along a first fold 38 and the snap fit portion 36 is foldable with respect to the main body portion 32 along a second fold 40. The shield portion 34 is movable along the first fold 38 between a non-deployed position (FIG. 3) and a deployed position (FIG. 5). FIG. 4 shows the shield portion partially folded. In a preferred embodiment, the shield portion 34 includes a bit opening 42 defined therein and a pair of flaps 44 that are received in slots 46 defined in the main body portion, when the shield portion 34 is in the deployed position. As shown in FIG. 5, in the deployed position, the shield portion 34 and the main body portion 32 cooperate to define a bit pocket 48.

7

In use, a portion of the drill bit **20** extends through the bit opening **42** and a blade portion **104** of the drill bit **20** is received in the bit pocket **48**.

Snap fit portion **36** is foldable along the second fold **40** and includes first and second arms **50** that cooperate to define a receiver slot **52** and a bit recess **54**. As shown in FIG. 3A, in a preferred embodiment, the receiver slot **52** defines a first width W1 and the bit recess **54** defines a second width W2. The first width W1 is narrower than the second width W2. Therefore, the receiver slot **52** is narrower than the bit recess **54**. It will be understood that the first width W1 is narrower than the diameter of a drill bit **20** (e.g., a shaft portion **102** of the drill bit **20**) and the second width W2 is wider than the diameter of the shaft portion **102** of the drill bit **20**. This allows the drill bit to snap fit through the receiver slot **52** and be retained in the bit recess **54**.

To assemble the card assembly **28** together with a drill bit **20**, the shield portion **34** is folded with respect to the main body portion **32** along first fold **38** and the flaps **44** are inserted through the slots **46** to form pocket **48**. The working or distal end **20a** of a drill bit **20** is then inserted through bit opening **42** such that the distal end **20a** is received in pocket **48**. The snap fit portion **36** is then folded with respect to the main body portion **32** along the second fold **40**. Next, the drill bit **20** is then snap fit through the receiver slot **52** and into the bit recess **54**. To form the drill bit package assembly **26**, the card assembly **28** and drill bit **20** are then placed in the pouch **30** and the pouch **30** is sealed.

The pouch **30** includes a closed end **56** and an open end **58**. In a preferred embodiment, when the card assembly **28** is received in the pouch **30**, the finger hole **37** is positioned adjacent the open end **58**. Therefore, in use, after the pouch **30** is unsealed, a user can place their finger through the finger hole **37** to remove the card assembly **28** and bit **20**. In a preferred embodiment, the batteries **24** are also disposed within a sterile pouch **30** or other packaging. As shown in FIG. 5, in a preferred embodiment, the end of the card assembly **28** opposite the shield portion **34** has a chevron shape **60** that is received in a similarly shaped portion **61** of the pouch **30** that is adjacent the open end **58**.

FIGS. 6-10 show a preferred embodiment of the adjustable drill guide **16**. Preferably, the adjustable drill guide **16** generally includes a guide tube **66**, an upper tube **68**, a barrel **70**, a handle **72** and a handle shaft **74**. In a preferred embodiment, the handle shaft **74** is attached to the upper tube **68** and extends at an angle therefrom. The angle allows a drill bit **20** to be inserted into the proximal opening **75** in the upper tube **68**. Different adjustable drill guides **16** can be provided with different angled handle shafts **74**, e.g., 60° and 75°. Different angles can be used for different patient anatomies and different surgeries. Any angle between about 10° and about 90° is within the scope of the present invention. FIG. 1 shows two different angled handle shafts **74** and handles **72** in the first kit **10**. The handle **72** can be temporarily (e.g., by threads **77**) or permanently attached to the handle shaft **74**.

As shown in FIG. 7, the upper tube **68** includes a main body portion **76**, external threads **78** disposed on the main body portion **76** and a collet **80** extending from a distal end of the main body portion **76**. The upper tube **68** also includes an upper tube tunnel **82** extending axially therethrough. The upper tube **68** also includes internal threads **84** and a window **86** defined therein that communicates the upper tube tunnel **82** with the exterior of the upper tube **68** and allows the guide tube **66** to be viewed, as described more fully below. In a preferred embodiment, the main body portion **76** also

8

includes measurement indicia **88** disposed thereon adjacent to the window **86**, as is best shown in FIG. 8.

In a preferred embodiment, the barrel **70** includes a barrel tunnel **90** extending axially therethrough and internal threads **92** that are matingly received on the external threads **78** of the upper tube **68**. The guide tube **66** includes a guide tube tunnel **94** extending therethrough and external threads **96** on a proximal end thereof that are matingly engaged with the internal threads **84** of the upper tube **68**. The guide tube extends through the barrel tunnel **90**. As shown in FIG. 10, the upper tube tunnel **82** and the guide tube tunnel **94** cooperate to define an internal guide tunnel **98** extending therethrough that is configured to receive a drill bit **20**. The guide tube **66** can include knurls **97** to help with adjustment. However, the knurls can be omitted.

In a preferred embodiment, the drill bits **20** include a collar **100** thereon, that has a wider dimension (e.g., diameter) than the internal guide tunnel **98**. This prevents the drill bit **20** from extending too far into the internal guide tunnel **98** and provides repeatability.

In use, the guide tube **66** (which has distal **66a** and proximal **66b** ends) is axially movable as a result of the interaction of external threads **96** and internal threads **84**. As shown in FIG. 8, the proximal end **66b** of guide tube **66** is viewable through window **86**. The indicia **88** next to the window **86** represent various depths that drill bit **20** will drill to if the proximal end **66b** of the guide tube **66** is lined up with the appropriate indicia **88** (e.g., just below the "8" as shown in FIG. 8). In an exemplary embodiment, the 8, 10, 12, 14, 16, 18 and 20 represent 8, 10, 12, 14, 16, 18 and 20 millimeter deep holes that will be drilled. In other words, when a drill bit **20** extends through the internal guide tunnel **98**, as shown in FIG. 8, if the proximal end **66b** of the guide tube **66** is lined up just below the "8", the distal end **20a** of the drill bit extends just under eight millimeters outside the distal end **66a** of the guide tube **66** (see FIG. 10). Therefore, a hole with a depth of just under eight millimeters will be drilled.

It will be appreciated by those of ordinary skill in the art that the barrel **70** can be rotated to secure or lock the guide tube **66** in place. When the barrel **70** is rotated clockwise (due to right handed threads) the barrel **70** squeezes the collet **80** which then squeezes the guide tube **66** to lock it in place and prevent axial movement via rotation. To adjust the axial position of the guide tube **66** (and the depth of a resulting hole), the barrel **70** is loosened, the guide tube **66** is rotated and adjusted axially and the guide tube **66** is retightened. This can be done when the drill bit **20** is extending through the internal guide tunnel **98** or when the internal guide tunnel **98** is vacant.

As shown in FIG. 11, the drill bit **20** includes collar **100**, a shaft portion **102**, a blade portion **104** at the distal end **20a** and a proximal end **20b** that includes a modified fitting **106** so that it can only mate with a collet **108** and opening **110** on the battery powered driver **12** and the manual driver **14** (shown in FIGS. 12-13). The collet **108** and opening **110** of the manual driver **14** is shown in FIG. 13. The battery powered driver **12** includes the same collet **108** and opening **110**. It will be appreciated that the opening **110** is uniquely shaped to mate with the proximal end **20b** of the drill bit **20**. In other words, the bit **20** and collet **108**/opening **110** are designed so they only fit with one another. Any type of fitting that accomplishes this is within the scope of the present invention.

As shown in FIG. 12, the manual driver **14** includes collet **108** and a handle **112** connected thereto. As shown in FIG. 14, the battery powered driver **12** includes collet **108** and a

handle portion 114 with control buttons 116 thereon (e.g., forward and reverse). Internally, the battery powered driver 12 includes a motor and associated electronics and components to rotate the drill bit 20 as necessary. The battery powered driver 12 also includes a docking portion 118 for docking one of the disposable batteries 24 discussed previously. Therefore, for each separate use, the battery 24 can be replaced.

Unless the context clearly requires otherwise, throughout the description and the claims, the words “comprise,” “comprising,” and the like are to be construed in an inclusive sense, as opposed to an exclusive or exhaustive sense; that is to say, in the sense of “including, but not limited to.” As used herein, the terms “connected,” “coupled,” or any variant thereof, means any connection or coupling, either direct or indirect, between two or more elements; the coupling of connection between the elements can be physical, logical, or a combination thereof. Additionally, the words “herein,” “above,” “below,” and words of similar import, when used in this application, shall refer to this application as a whole and not to any particular portions of this application. Where the context permits, words in the above Detailed Description of the Preferred Embodiments using the singular or plural number may also include the plural or singular number respectively. The word “or” in reference to a list of two or more items, covers all of the following interpretations of the word: any of the items in the list, all of the items in the list, and any combination of the items in the list.

The above-detailed description of embodiments of the disclosure is not intended to be exhaustive or to limit the teachings to the precise form disclosed above. While specific embodiments of and examples for the disclosure are described above for illustrative purposes, various equivalent modifications are possible within the scope of the disclosure, as those skilled in the relevant art will recognize. For example, while processes or blocks are presented in a given order, alternative embodiments may perform routines having steps, or employ systems having blocks, in a different order, and some processes or blocks may be deleted, moved, added, subdivided, combined, and/or modified to provide alternative or subcombinations. Each of these processes or blocks may be implemented in a variety of different ways. Also, while processes or blocks are at times shown as being performed in series, these processes or blocks may instead be performed in parallel, or may be performed, at different times. Further any specific numbers noted herein are only examples: alternative implementations may employ differing values or ranges.

The teachings of the disclosure provided herein can be applied to other systems, not necessarily the system described above. The elements and acts of the various embodiments described above can be combined to provide further embodiments.

Any patents and applications and other references noted above, including any that may be listed in accompanying filing papers, are incorporated herein by reference in their entirety. Aspects of the disclosure can be modified, if necessary, to employ the systems, functions, and concepts of the various references described above to provide yet further embodiments of the disclosure.

These and other changes can be made to the disclosure in light of the above Detailed Description of the Preferred Embodiments. While the above description describes certain embodiments of the disclosure, and describes the best mode contemplated, no matter how detailed the above appears in text, the teachings can be practiced in many ways. Details of the system may vary considerably in its implementation

details, while still being encompassed by the subject matter disclosed herein. As noted above, particular terminology used when describing certain features or aspects of the disclosure should not be taken to imply that the terminology is being redefined herein to be restricted to any specific characteristics, features or aspects of the disclosure with which that terminology is associated. In general, the terms used in the following claims should not be construed to limit the disclosures to the specific embodiments disclosed in the specification unless the above Detailed Description of the Preferred Embodiments section explicitly defines such terms. Accordingly, the actual scope of the disclosure encompasses not only the disclosed embodiments, but also all equivalent ways of practicing or implementing the disclosure under the claims.

Accordingly, although exemplary embodiments of the invention have been shown and described, it is to be understood that all the terms used herein are descriptive rather than limiting, and that many changes, modifications, and substitutions may be made by one having ordinary skill in the art without departing from the spirit and scope of the invention.

What is claimed is:

1. A card assembly for use with a drill bit, the card assembly comprising:
 - a main body portion that includes first and second ends and a snap fit portion positioned between the first and second ends, wherein the snap fit portion includes first and second arms that cooperate to define a receiver slot and a bit recess, wherein the receiver slot is narrower than the bit recess;
 - a shield portion connected to the first end of the main body portion along a fold, wherein the shield portion is foldable with respect to the main body portion between a deployed position and a non-deployed position, wherein the shield portion includes a bit opening defined therein, and wherein the shield portion and the main body portion cooperate to define a bit pocket when the shield portion is in the deployed position;
 - wherein the snap fit portion is connected to the main body portion along a fold, and wherein the snap fit portion is foldable between a non-deployed position and a deployed position; body portion includes a finger hole defined therein at a location adjacent the second end thereof; and
 - wherein the shield portion includes first and second flaps, wherein the main body portion includes first and second slots defined therein, and wherein the first and second flaps are received in the first and second slots when the shield portion is in the deployed position.
2. The card assembly of claim 1 wherein the second end of the main body portion has a chevron shape.
3. A drill bit package assembly comprising:
 - a card assembly comprised of a main body portion that includes first and second ends and a snap fit portion positioned between the first and second ends, and a shield portion connected to the first end of the main body portion along a fold wherein the shield portion is foldable with respect to the main body portion between a deployed position and a non-deployed position, wherein the shield portion includes a bit opening defined therein, and wherein the shield portion and the main body portion cooperate to define a bit pocket when the shield portion is in the deployed position, wherein the shield portion includes first and second flaps, wherein the main body portion includes first and second slots defined therein, and wherein the first and

11

- second flaps are received in the first and second slots when the shield portion is in the deployed position,
- a drill bit that includes a shaft portion and a blade portion, wherein the drill bit is removably secured to the card assembly, and
- a sterile pouch that defines an interior, wherein the card assembly and drill bit are disposed in the interior of the sterile pouch.
4. The drill bit package assembly of claim 3 wherein the shaft portion of the drill bit is received in the snap fit portion of the card assembly and the blade portion of the drill bit is received in the bit pocket of the card assembly.
5. The drill bit package assembly of claim 3 wherein the snap fit portion includes first and second arms that cooperate to define a receiver slot and a bit recess, wherein the receiver slot is narrower than the bit recess, wherein the receiver slot is narrower than a diameter of the shaft portion, and wherein the bit recess is wider than the diameter of the shaft portion.
6. The drill bit package assembly of claim 3 wherein the drill bit extends through the bit opening such that the blade portion is disposed in the bit pocket.
7. The drill bit package assembly of claim 3 wherein the card assembly includes a finger hole through the main body portion and disposed adjacent to the second end thereof so as to be positioned beyond an adjacent shaft portion of the drill bit when held within the card assembly.
8. The drill bit package of claim 3 wherein the snap fit portion includes first and second arms that cooperate to define a receiver slot and a bit recess, wherein the receiver slot is narrower than the bit recess.
9. A drill bit package assembly comprising:
- a card assembly comprised of a main body portion that includes first and second ends and a snap fit portion positioned between the first and second ends, wherein the snap fit portion includes first and second arms that cooperate to define a receiver slot and a bit recess, and a shield portion connected to the first end of the main body portion along a fold, wherein the shield portion is

12

- foldable with respect to the main body portion between a deployed position and a non-deployed position, wherein the shield portion includes a bit opening defined therein, and wherein the shield portion and the main body portion cooperate to define a bit pocket when the shield portion is in the deployed position;
- a drill bit having a shaft portion and a blade portion, the drill bit being removably secured to the card assembly such that the shaft portion is received in the bit recess of the snap fit portion and the blade portion is received in the bit pocket of the card assembly;
- a sterile pouch having an interior in which the card assembly and drill bit are disposed; and
- a finger hole through the main body portion of the card assembly and disposed adjacent to the second end thereof so as to be positioned beyond an adjacent shaft portion of the drill bit when held within the card assembly.
10. The drill bit package assembly of claim 9 wherein the sterile pouch includes a chevron-shaped openable seal.
11. The drill bit package assembly of claim 10 wherein the second end of the main body portion of the card assembly has a chevron shape that corresponds with the chevron-shaped openable seal of the sterile pouch such that when the chevron-shaped openable seal is opened, the second end and the finger hole of the main body portion extends outwardly from the sterile pouch.
12. The drill bit package assembly of claim 11 wherein the snap fit portion is connected to the main body portion along a fold, and wherein the snap fit portion is foldable between a non-deployed position and a deployed position.
13. The drill bit package assembly of claim 11 wherein the shield portion includes first and second flaps, wherein the main body portion includes first and second slots defined therein, and wherein the first and second flaps are received in the first and second slots when the shield portion is in the deployed position.
